The 1-g and 10-g SAR test exclusion thresholds for 100 MHz to 6 GHz at *test separation distances* ≤ 50 mm are determined by:

[(max. power of channel, including tune-up tolerance, mW)/(min. test separation distance, mm)] · [√f_(GHz)] ≤ 3.0 for 1-g SAR and ≤ 7.5 for 10-g extremity SAR,₁₆ where □ f_(GHz) is the RF channel transmit frequency in GHz □ Power and distance are rounded to the nearest mW and mm before calculation₁₇ □ The result is rounded to one decimal place for comparison

The test exclusions are applicable only when the minimum test separation distance is ≤ 50 mm and for transmission frequencies between 100 MHz and 6 GHz. When the minimum test separation

distance is < 5 mm, a distance of 5 mm is applied to determine SAR test exclusion.

FCC ID: 2AAA3TEC-002

Maximum measured transmitter power

Output Power(Max	1.011dBm
Conducted):	

The max.output power is 1.011dBm=1.26mW, Frequency is 2.48GHz

So (1.26/5)* √2.48=0.396≤ 3.0

Conclusion: No SAR is required.
